

# Remote sensing studies in Finnish project sites

Aleksi Isoaho

# Drone flights by University of Eastern Finland

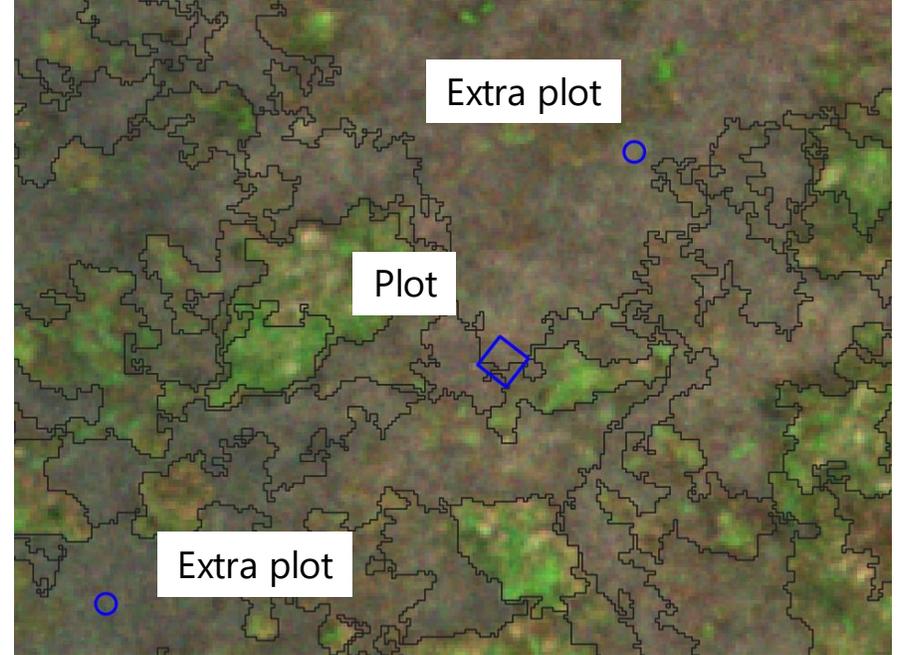

- Before-restoration flights conducted end of July 2023
- First after-restoration flights beginning of August 2024
- Multispectral (spatial resolution of 5 cm) and thermal imagery (spatial resolution of 30 cm) with MicaSense Altum-PT
- Drone LiDAR
  - Digital terrain and surface models with 10 and 20 cm resolution

# Vegetation inventories

- Initially 206 plots were established
- Species level inventories conducted 153/206 of the plots
- Rest of the plots have Plant Functional Type coverage inventoried
  - Aim is to integrate these plots to classification system which is constructed from species-level plots

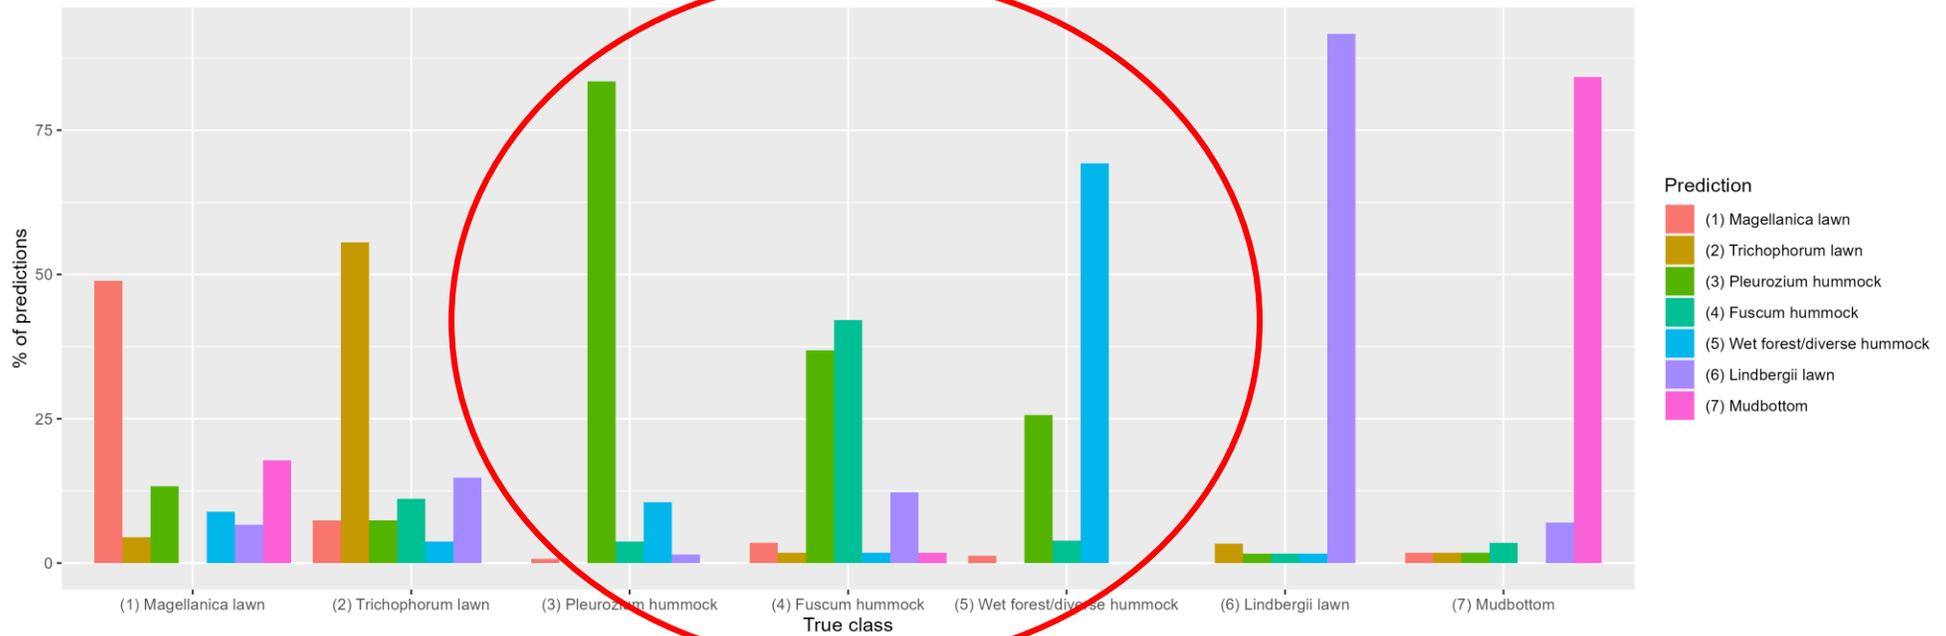

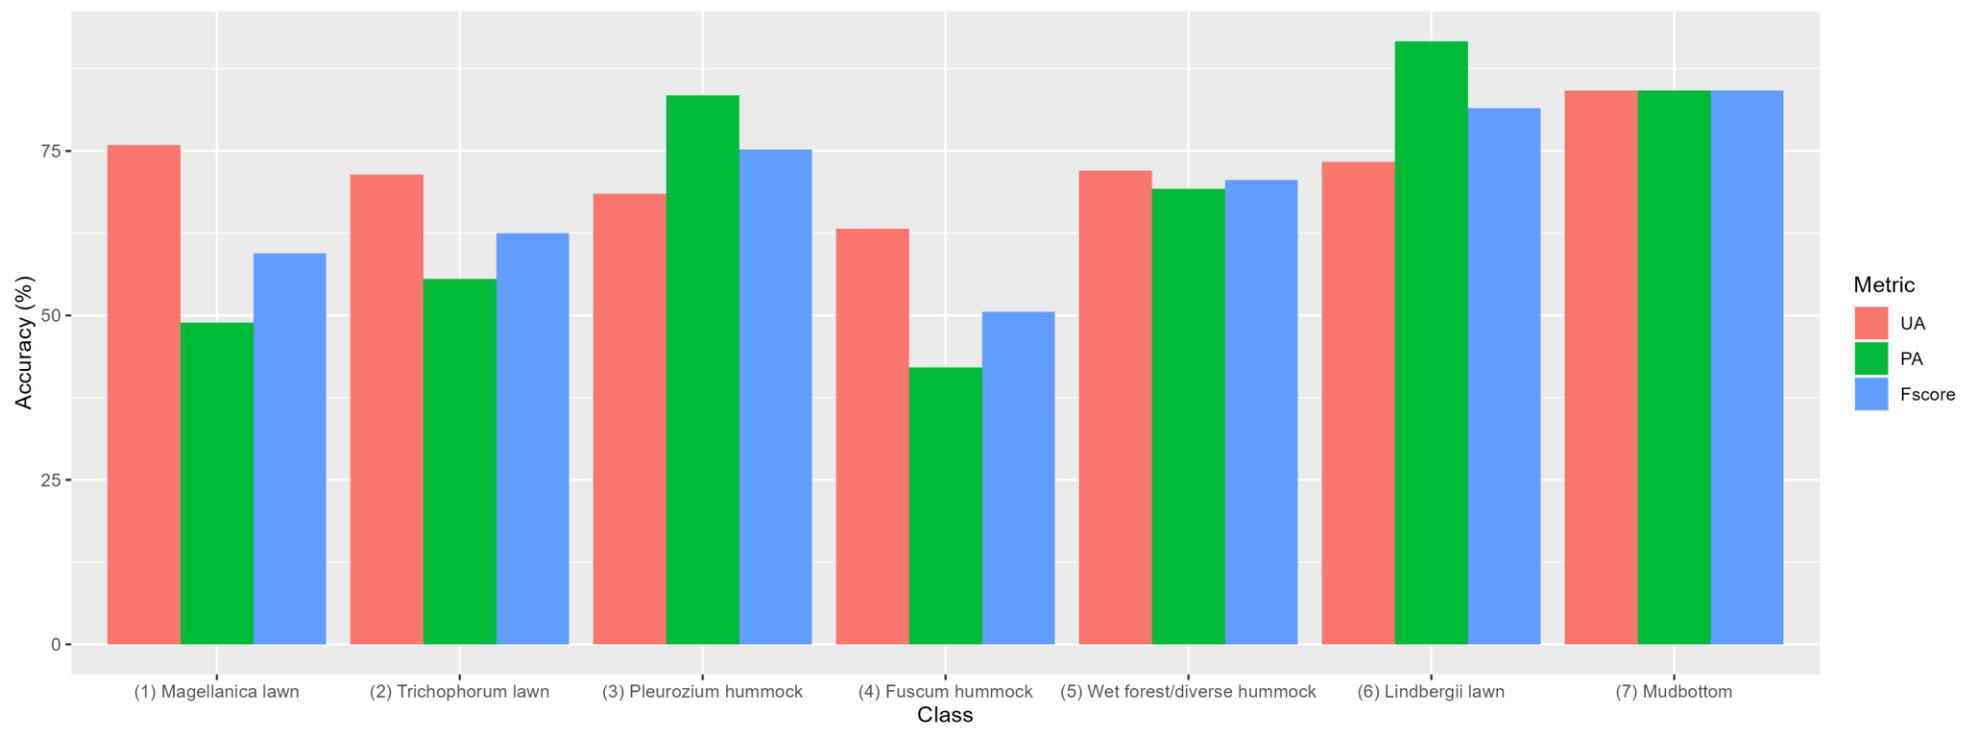

# Upscaling strategy

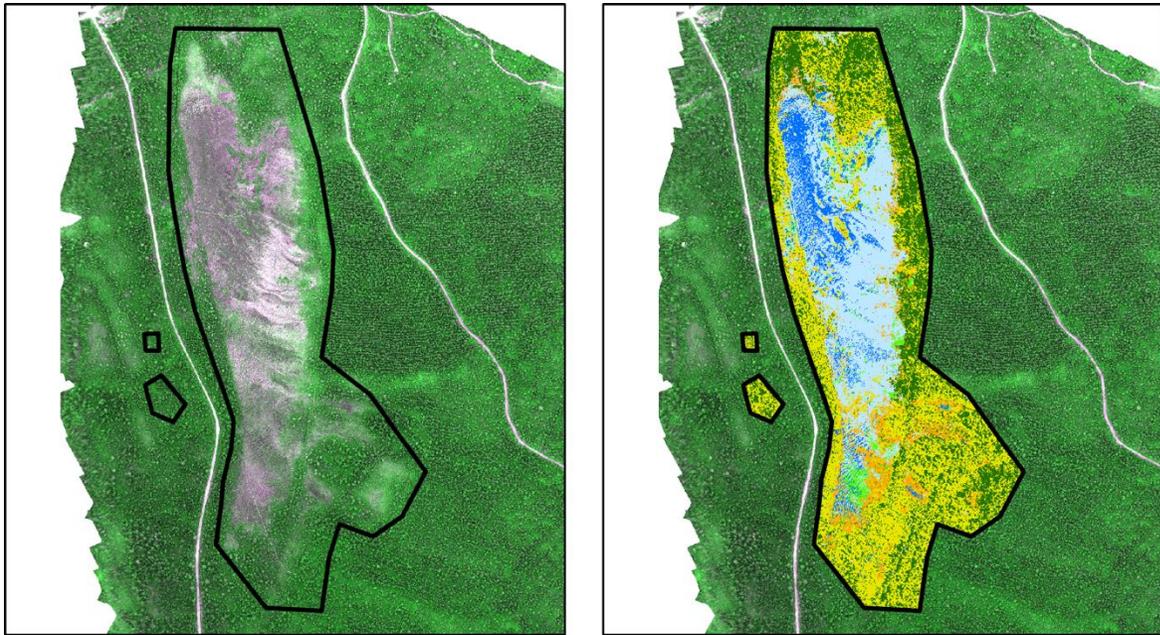

- Object-based image analyses
  - Drone spectral bands and indices
  - LiDAR topographical features
  - NLS Aerial image and textures (GLCMs)
  - Mean shift segmentation and random forest classification
- Preliminary tests with vegetation data-based clusters
  - Clustering performed by Jack Chapman (FMI)
  - 7 clusters
  - Due to limited number of plots, I added 2 extra train plots per true plot with visual interpretation → better capture variation in RS data within clusters
- Classification to GEST-types later

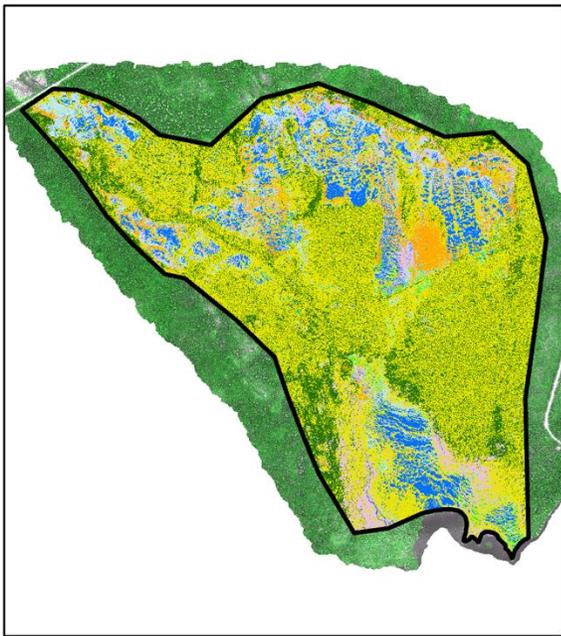

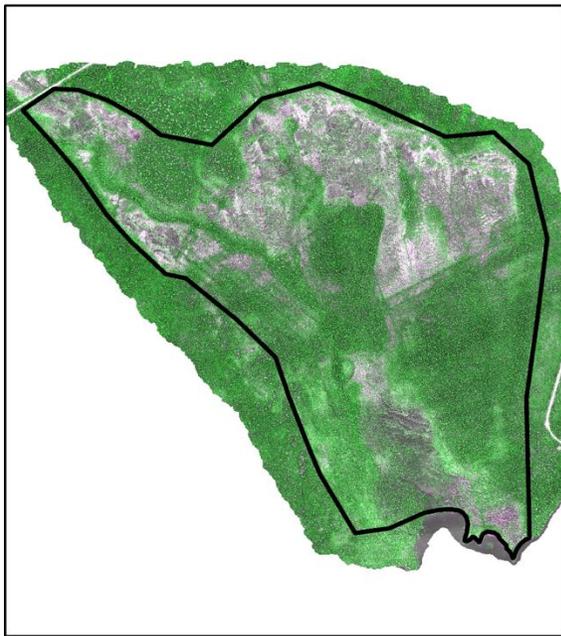

# Cluster classification accuracy

- Overall accuracy around 70%
  - With 153 plots overall accuracy was around 53%
  - Spatial autocorrelation might be a problem with increased dataset
- Some clusters classify more accurate than others
  - Mudbottom, i.e. hollow/flark
  - Lindbergii lawn
- Wet forest/diverse hollow and pleurozium hollow mix up quite a lot
  - Both clusters occupy treed areas

0 0.25 0.5 km

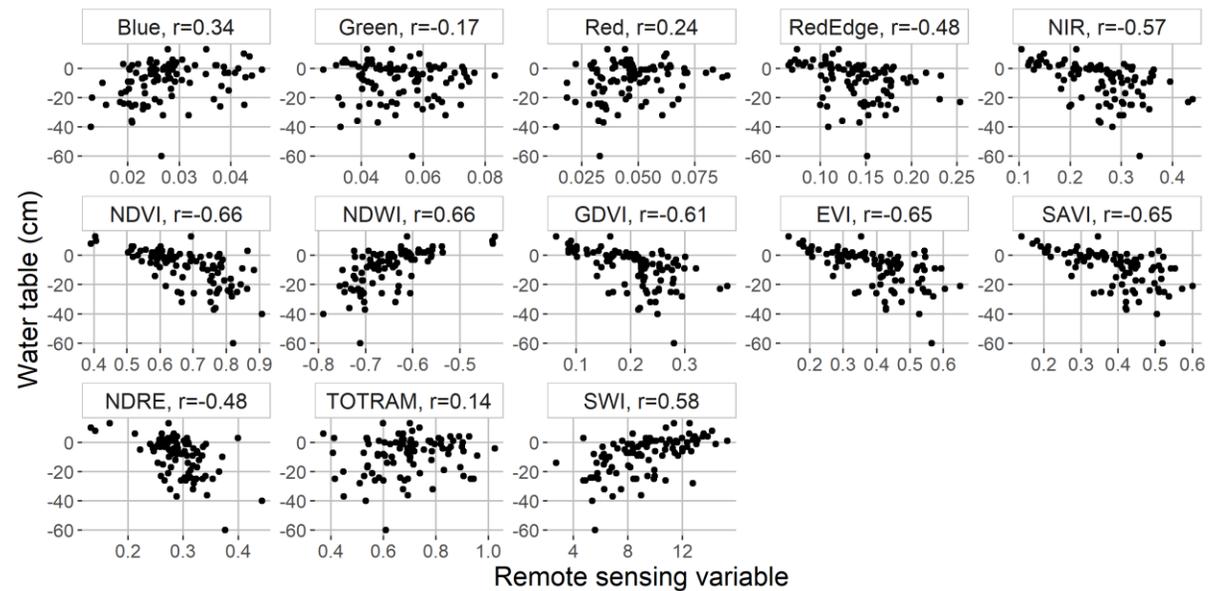

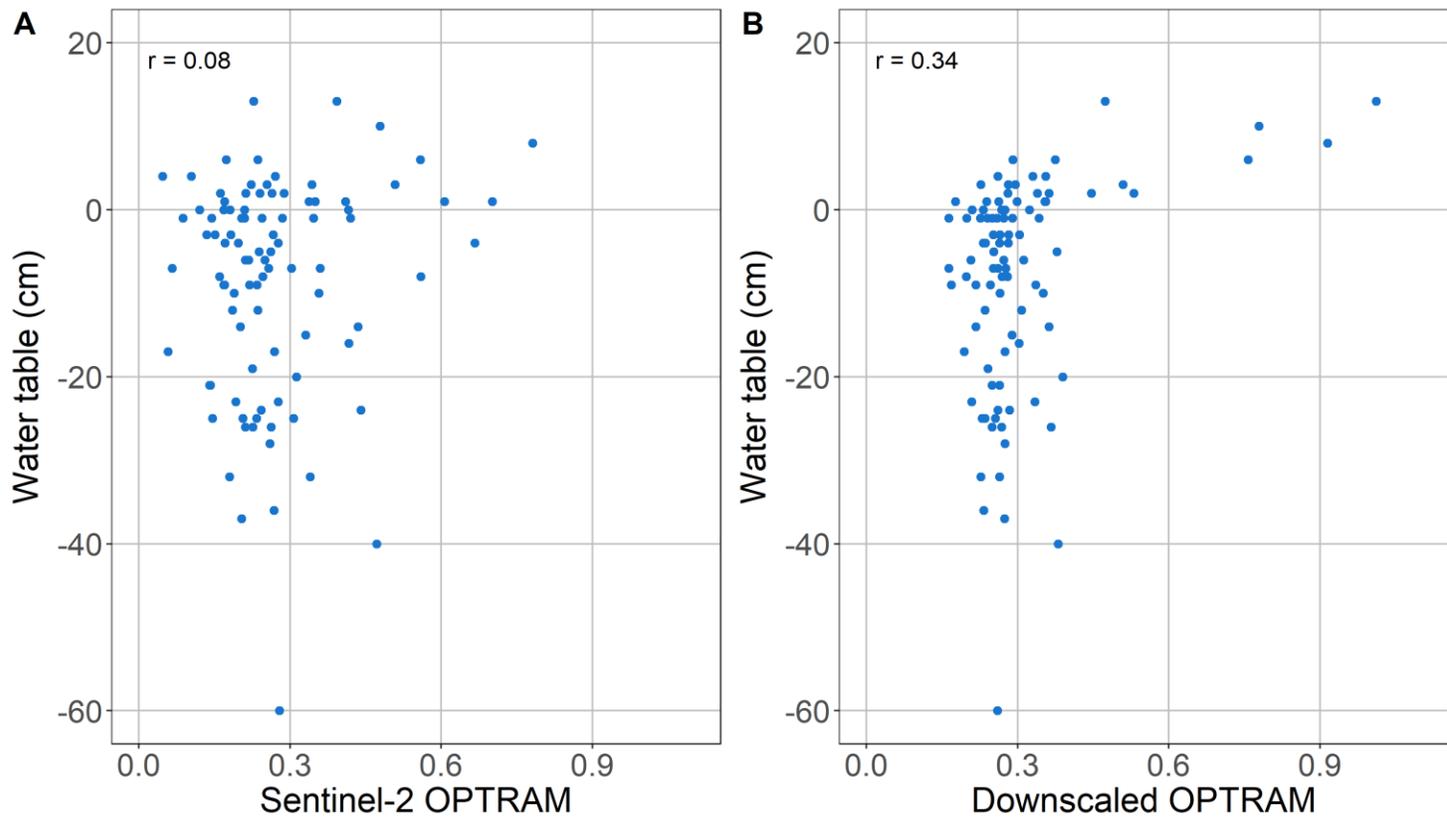

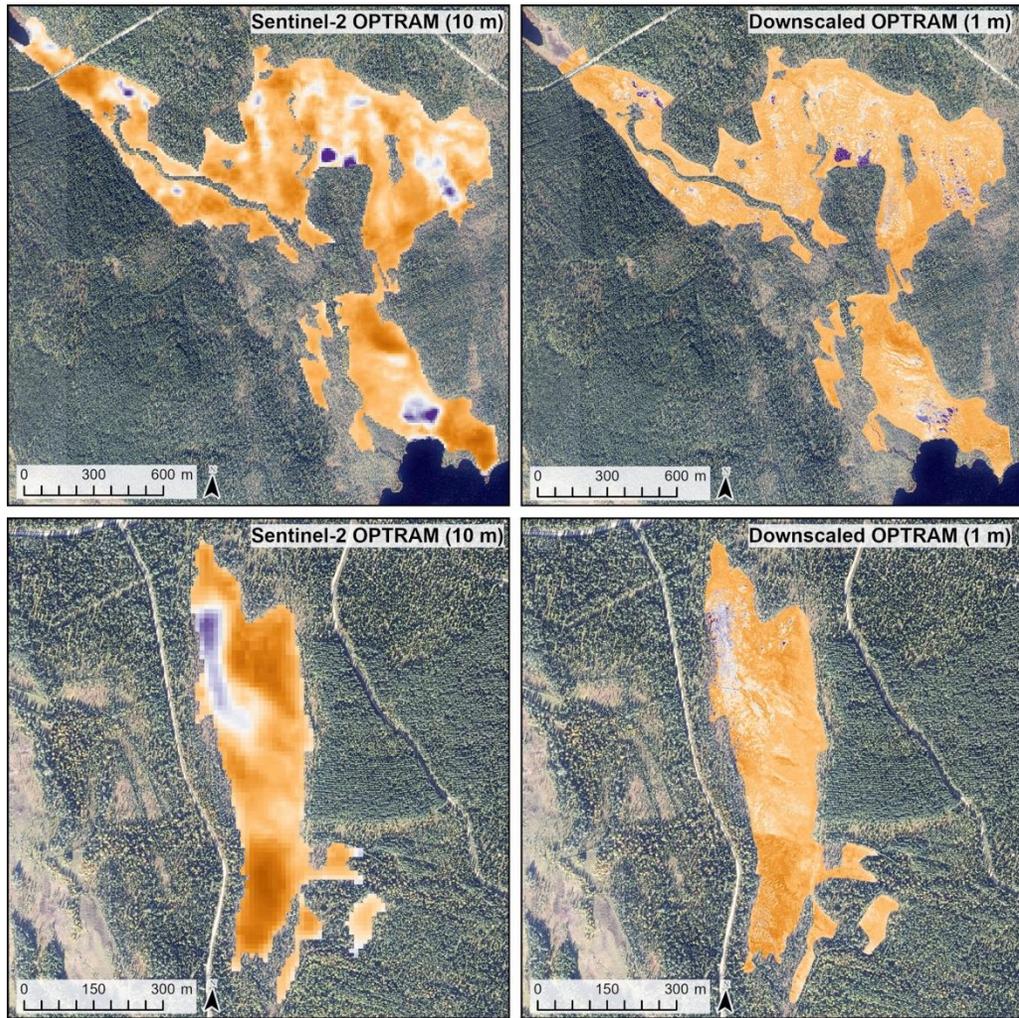

0 0.5 1 km

|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
|  (1) Magellanica lawn   |  (4) Fuscum hummock             |  (7) Mudbottom |
|  (2) Trichophorum lawn  |  (5) Wet forest/diverse hummock |                                                                                                     |
|  (3) Pleurozium hummock |  (6) Lindbergii lawn            |                                                                                                     |

# Wetness related studies

- Manual water table measurements from vegetation plots during July 2023
- Downscaling satellite-based information with drone imagery
- Does the downscaling improve relationship between WT and satellite-based moisture index?
- How other drone-based variables relate to WT?
- Performed by Saara Heikkinen
  - Worked as a trainee last summer for closely related project
  - Currently writing master thesis
- Additionally, synergy possibilities with University of Oulu with integrated ground water modelling and remote sensing

# Thank you!
